

# FTW

## FIND THE WIRE

---

Find the Wire (FTW) is a troubleshooting tool to aid in the connection of non-adapted points during a test process.

---

Find The Wire uses your Address Correspondence Table (ACT) file to identify non-adapted wires or connector points. The FTW feature includes the following:

- A simple probe
- A second monitor with video splitter
- FTW program
- High voltage disable

The FTW program works by using the last address in your switching system and performing a high speed lower order scan to locate where the probe is touching. The program then displays the DIT-MCO switching address as well as the UUT information from your ACT file.

It is displayed in a large font for easier readability. The second monitor acts as a dummy terminal to have a display away from the test analyzer.

As a safety precaution, FTW disables the high voltage power supply to prevent operators from getting hurt by accidentally touching the probe.
